

HOT OFF THE PRESS!

Initial field trials of Biosource treated baits, conducted independently by personnel at Sparsholt College, Hampshire, have shown Biosource to out fish identical non-treated baits.

The original data, reproduced below, was simply cut 'n pasted from the Sparsholt tester's first report.

“Just thought id drop you a line and let you know how things were getting on. I have undertaken several days fishing for my dissertation.... With regards to the bait I have been consistently using a basic trout pellet I obtained from our hatchery manager, as time was of the essence.

Below are the results of "B" (left) vs. no "B" (right).

8-2

18-10

13-9

10-9

8-5

23-14

12-7

16-12

7-8

TOTAL 115 – 76

As you can see, the results speak for themselves. At first my colleagues were skeptical so they came down and participated blindly and they were immediately proved wrong with my two closest mates (current British Carp Angling Champions) astounded by the results and eagerly wanting to apply "B" to their matches and own fishing. With a variety of species being caught proving anything is susceptible to the pulling power "B" produces. I have also noticed that with bait dosed with "B" the feeding response has been much quicker.”
